**Abstract.** Abstract goes here

**Keywords:** keyword1, keyword2

## 1 Introduction

Hello, here is some text without a meaning. This text should show what a printed text will look like at this place.  $\sin^2(\alpha) + \cos^2(\beta) = 1$ . If you read this text, you will get no information  $E = mc^2$ . Really? Is there no information? Is there a difference between this text and some nonsense like “Huardest gefburn”? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look.  $\sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$ . This text should contain all letters of the alphabet and it should be written in of the original language.  $\frac{\sqrt[n]{a}}{\sqrt[n]{b}} = \sqrt[n]{\frac{a}{b}}$ . There is no need for special content, but the length of words should match the language.  $a \sqrt[n]{b} = \sqrt[n]{a^n b}$ . Winery [1] is graphical modeling tool.

Simple Figure

**Fig. 1.** Simple Figure

**Table 1.** Simple Table

Simple Table

```
public class Hello {
    public static void main (String[] args) {
        System.out.println("Hello World!");
    }
}
```

**List. 1.** Example Listing

Package minted was not loaded, so there is no XML code shown.  
In case you load minted, please be sure to

- a) Have python and pygments installed
- b) Execute pdflatex using `-shell-escape`

```
xml <demo> <node> <!-- comment --> || </node> </demo>
```

**Fig. 2.** XML-Dokument rendered using minted

Listing 1 shows a listing typeset using the `lstlisting` environment.

`minted` is an alternative package, which enables syntax highlighting using `pygments`. This, in turn, requires Python, so it is disabled by default. In case you load it above, be sure to run `pdflatex` with `-shell-escape` option. Figure 2 shows an XML-Listing. You can point to a single line: line 2. If you do not want to use `minted`, just delete the example listing and this paragraph.

`cref` Demonstration: `Cref` at beginning of sentence, `cref` in all other cases.

Figure 1 shows a simple fact, although Fig. 1 could also show something else.

Table 1 shows a simple fact, although Table 1 could also show something else.

Section 1 shows a simple fact, although Sect. 1 could also show something else.

Brackets work as designed: `<test>`

The symbol for powerset is now correct:  $\wp$  and not a Weierstrass  $p$  ( $\wp$ ).

1. All these items... 2. ...appear in one line 3. This is enabled by the `paralist` package.

“something in quotes” using plain tex or use “the enquote command”.

You can now write words containing hyphens which are hyphenated (application-specific) at other places. This is enabled by an additional configuration of the `babel` package. In case you write “application-specific”, then the word will only be hyphenated at the dash. You can also write application-specific, but this is much more effort.

## 2 Conclusion and Outlook

### Acknowledgments ...

In the bibliography, use `\textsuperscript` for “st”, “nd”, ...: E.g., “The 2<sup>nd</sup> conference on examples”. When you use `JabRef`, you can use the `clean up` command to achieve that. See <https://help.jabref.org/en/CleanupEntries> for an overview of the `cleanup` functionality.
